

SDG 15.3.4

SDG 15 Life on Land

Alien species impact reduction

Mariano Marcos State University · THE Sustainability Impact Ratings 2027

THE QUESTION

Have a policy to reduce the impact of alien species on campus.

1 Introduction

In MMSU, the University Environmental Policies, the University Research and Development Agenda (URDA) 2024–2028 and the goals of the Natural Resources Conservation and Management Center (NRCMC) guide the commitment to biodiversity protection and sustainable natural resource management, including the potential impacts of alien and invasive species on campus ecosystems. The NRCMC aims to sustain natural resource health and ecosystem services and to establish in situ and ex situ conservation initiatives for Ilocos flora and fauna through interdisciplinary, multisectoral and interagency collaboration. These directions provide the technical basis for biodiversity assessment, identification and monitoring of alien and potentially invasive species, appropriate management interventions, and the promotion of native species in campus landscaping and rehabilitation to minimize ecological impacts and protect native biodiversity.

2 Body

2.1 Institutional Frameworks that Guide the Management of Alien and Invasive Species

Ongoing programme · University Research and Development Agenda 2024–2028

The Mariano Marcos State University (MMSU), while guided by its existing University Environmental Policies, University Research and Development Agenda (URDA) 2024–2028, and the goals and objectives of the Natural Resources Conservation and Management Center (NRCMC), continues to strengthen its commitment to biodiversity protection and sustainable natural resource management. These institutional frameworks serve as guiding principles for addressing the potential impacts of alien and invasive species on campus ecosystems. Specifically, the NRCMC aims to sustain natural resource health and ecosystem services and establish in situ and ex situ conservation initiatives for Ilocos flora and fauna through interdisciplinary, multisectoral, and interagency collaboration. In support of SDG 15.3.4, these directions provide the technical basis for biodiversity assessment, identification and monitoring of alien and potentially invasive species, appropriate management interventions, and promotion of native species in campus landscaping and rehabilitation to minimize ecological impacts and protect native biodiversity.

3 Conclusion

These frameworks set the direction. A memorandum from the Office of the President requiring native species in campus planting and the control of invasive species would turn that direction into a written rule; the native planting already under way in the forest reserves, the mangroves and the Learning Center would then sit under it.
